

Assignment 2

documentation

Student Name: Hardik Rathee

Student ID: 3173940

This app helps you find recipes using ingredients you have at home. When you run the program, it first checks if you've searched for any ingredients before. If you have, it will ask if you want to search for that same ingredient again. You can say yes or no. If you say no, or if it's your first time using the app, it will ask you to type in any ingredient like "potato" or "chicken".

Once you enter an ingredient, the app connects to a free recipe website to find meals containing that ingredient. It shows you the recipe name, all the ingredients needed, and step-by-step cooking instructions. The app is smart enough to save the last recipe you looked at, so if your internet stops working, it can still show you that last recipe instead of just giving an error.

The program keeps two small files on your computer to remember things. One file saves your last searched ingredient so it can ask if you want to use it again. The other file saves the last recipe you viewed so you can still see it offline. If something goes wrong, like if you type something that's not a food item, the app won't crash but will handle it properly.

In the future, this app could be improved to search by meal types like breakfast or dinner, or to let you save multiple favorite recipes. For now, it does its main job well - helping you find recipes based on what ingredients you have.
